SUSTAINABLE FINANCELIVE 2026 · TEAM TWO · PS1

Springforth

Coordinate first. Community plans, “I want to…” declarations and funding pledges become coordinated commitments — activated at quorum, evidenced on a hash-chained ledger.

Live: springforth.widespread.workers.dev

MIT-open · github.com/TerexitariusStomp/springforth

THE COORDINATION GAP

Plans live in different systems. Overlap stays invisible until it’s too late.

Surface → declare a possibility

Match → quorum + overlap detection

Fund → demand-gated pledges

Deliver → reports + appreciation

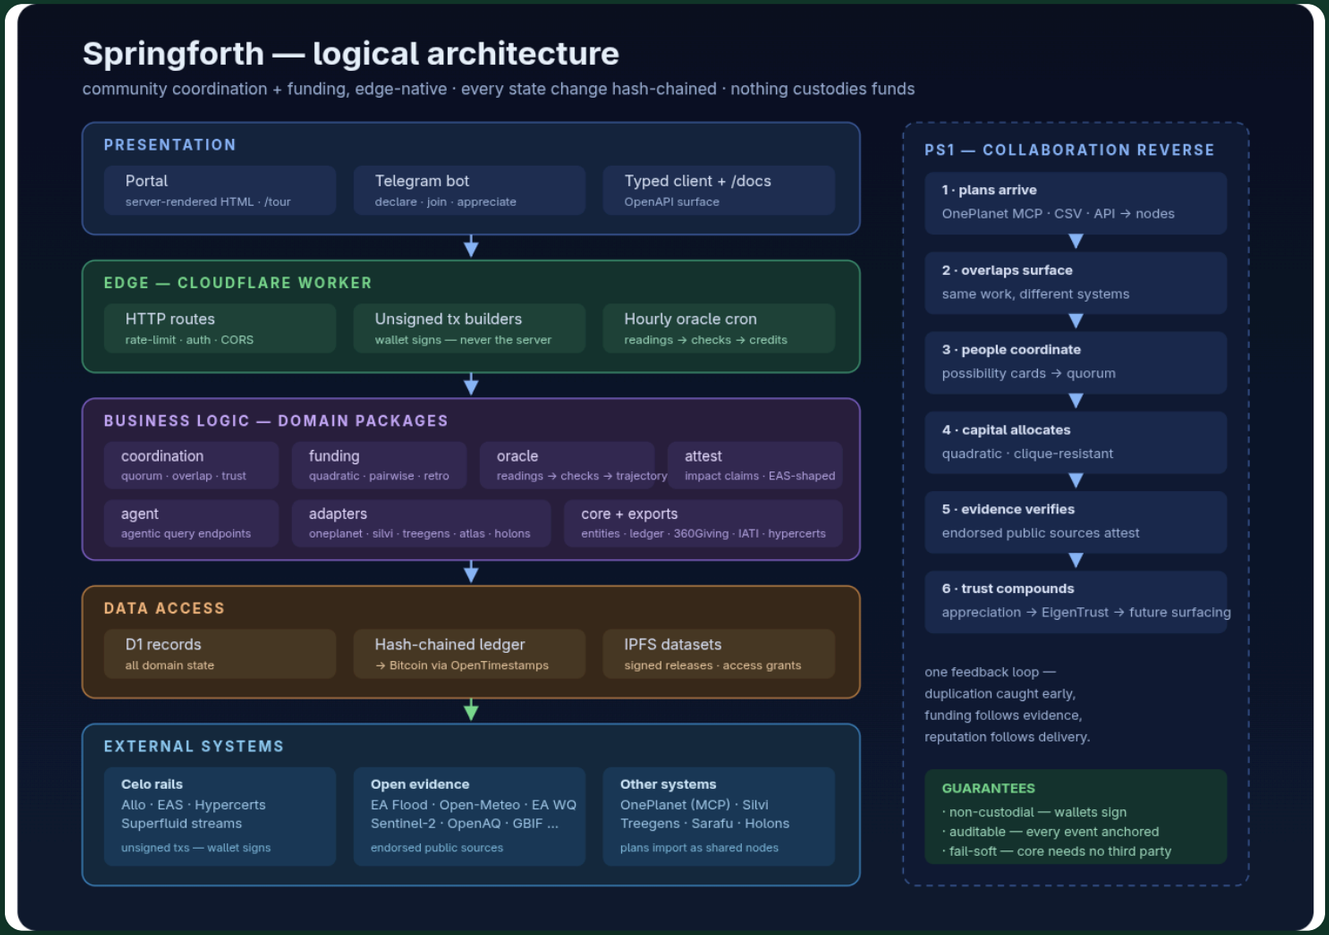

Measure → oracle checks + ledger

Steward → council seats at quorum

YOUR OWN MODEL

The bootcamp’s marketplace for community liquidity — Surface, Match, Fund, Deliver, Measure, Steward — is literally this lifecycle. Springforth is that layer, running.

LOGICAL ARCHITECTURE

Coordination kernel → evidence lane → funding lane → stewardship. Ten seconds.

LIVE ON PRODUCTION — NOT A MOCKUP

The demo, in six legs

Feed	reason lines + signals — /possibilities
Card	quorum, council, value — click a card
Overlap	4 pursuing one outcome — /collaborate
Evidence	endorsed sources — /impact
Funding	demand-gated rounds — /fund
Audit	map + ledger-verify

Audience quorum card — scan, join, watch it activate.

springforth.widespread.workers.dev

TREASURER-GRADE VALUE

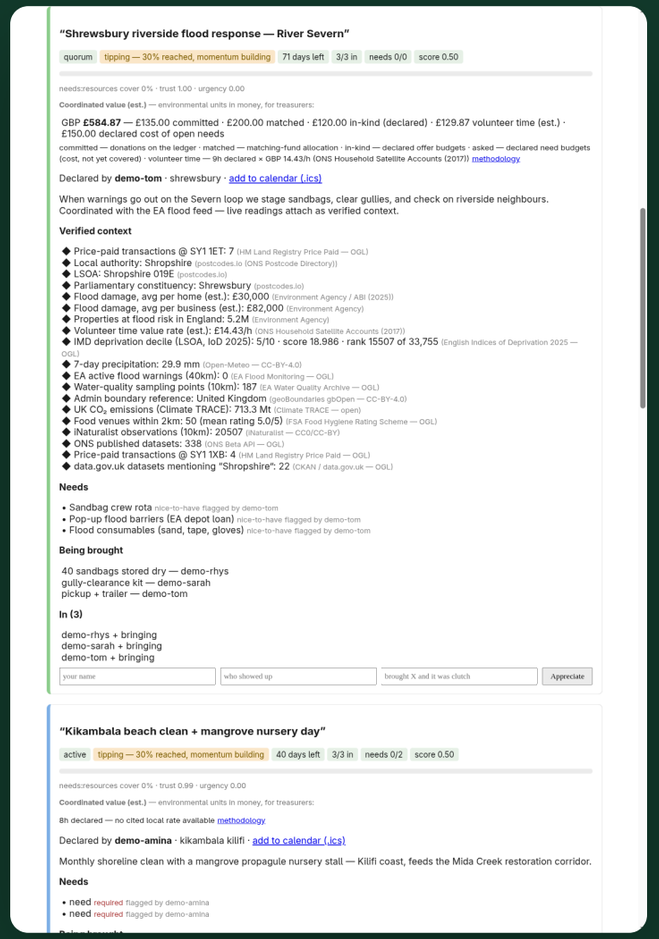

Four capitals, kept distinct — every figure replayable from the ledger.

Financial committed + matched

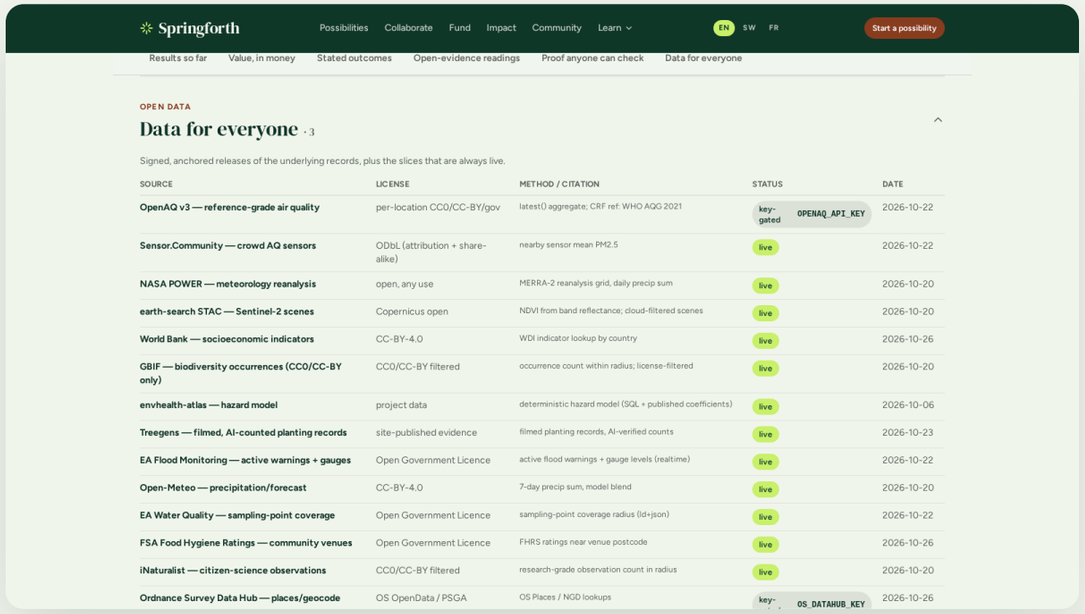

Human volunteer hours at ONS rates

Social in-kind, never converted

Natural risk-avoided, e.g. £360k flood

USE OF DATASETS

Endorsed sources, read hourly — honestly tiered.

EA Flood, Open-Meteo, FHRS, IoD 2025, Sentinel-2 STAC live and keyless; Companies House, OS, EO Data Hub marked key-gated. OnePlanet MCP + Sarafu imports carry provenance.

BUSINESS MODEL + FEASIBILITY

Revenue where value already moves

SETTLEMENT FEE

Funder-side fee on matched rounds — no new behaviour required.

HOSTED DEPLOYMENTS

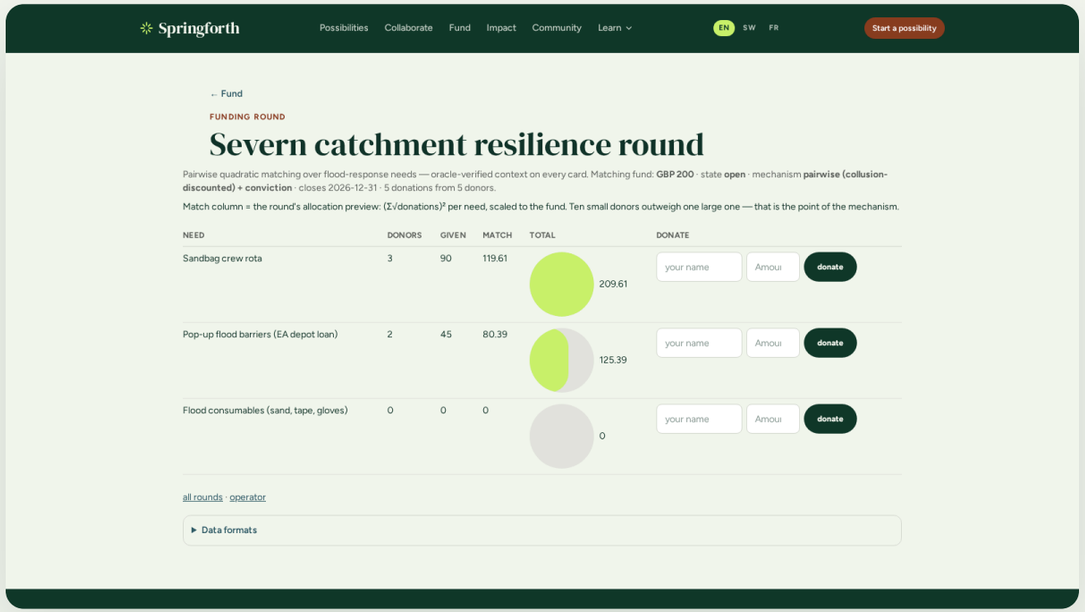

Councils and partnerships run their own coordination instance.

DATASET REVENUE

Consented, ledger-anchored audit corpus — sold only when worth selling.

Non-custodial by construction — the only money we touch is the fee. Pilot path: BRP in the UK, a Sarafu community in Kenya; the seed data already spans both.

FEASIBILITY — IT RUNS NOW

7,123 hash-chained ledger events, /ledger/verify green

3,689 plan nodes — OnePlanet, Sarafu, Treegens, council CSVs

2 countries live — UK flood response + Kenya mangroves

186 real field-evidence pins on /map

WHY THIS WINS

The coordination problem that formed this team is the one we sell the fix for.

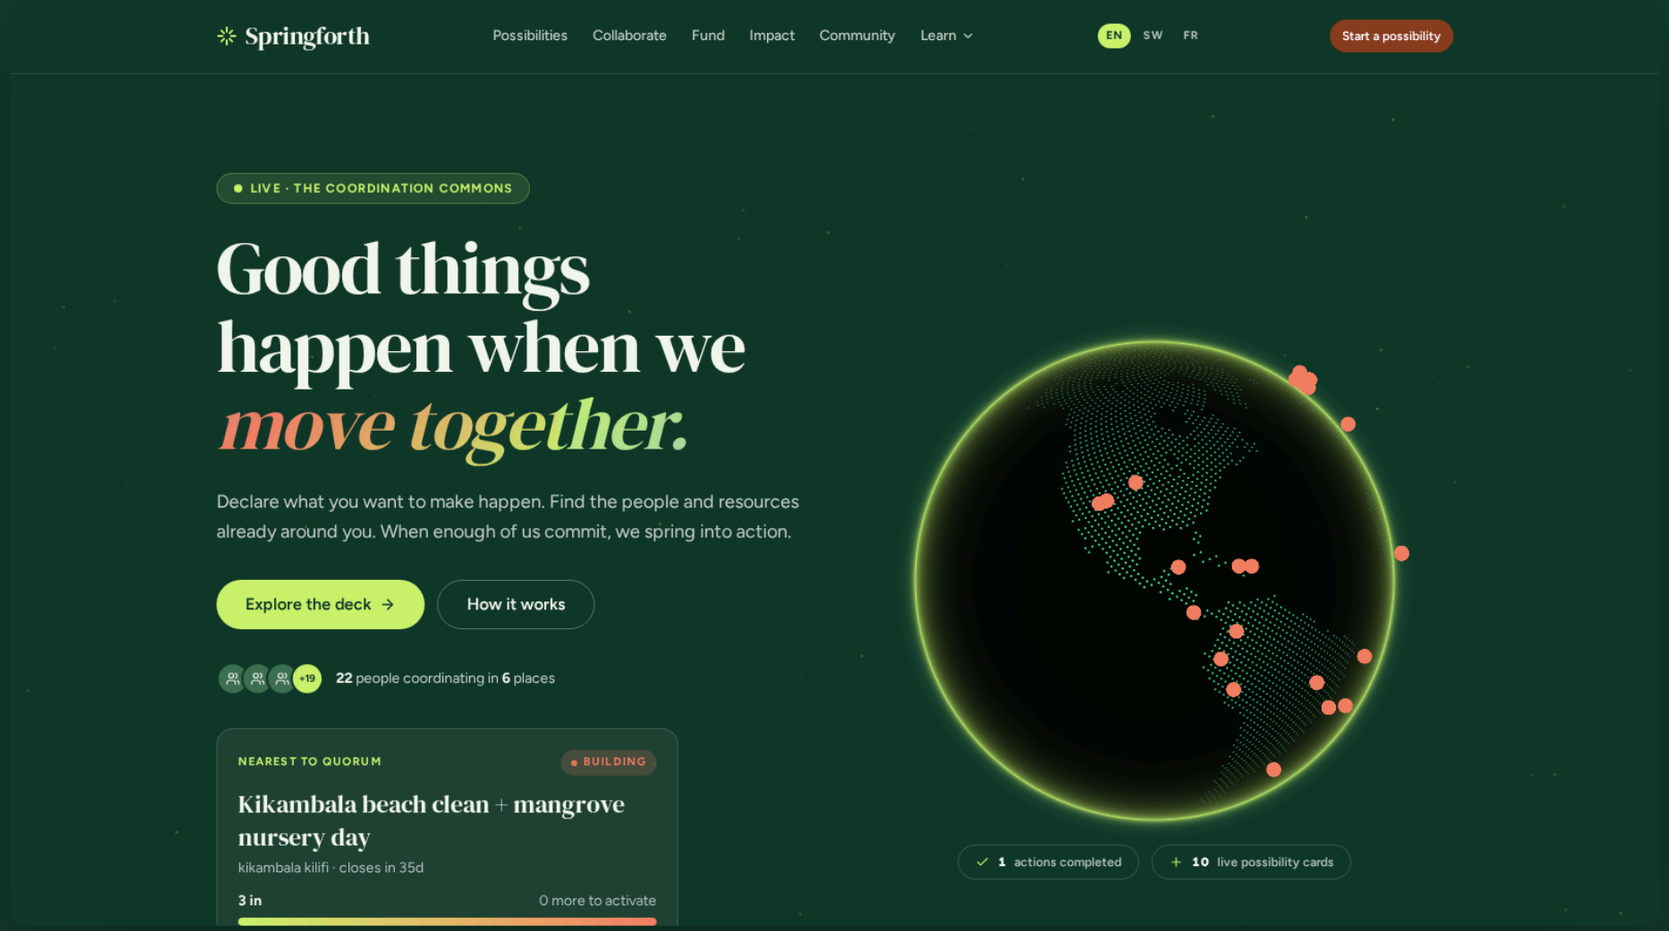

Demo, business idea, technical implementation, datasets, feasibility, scalability, impact — answered live, on a ledger any reviewer can replay.

Q & A

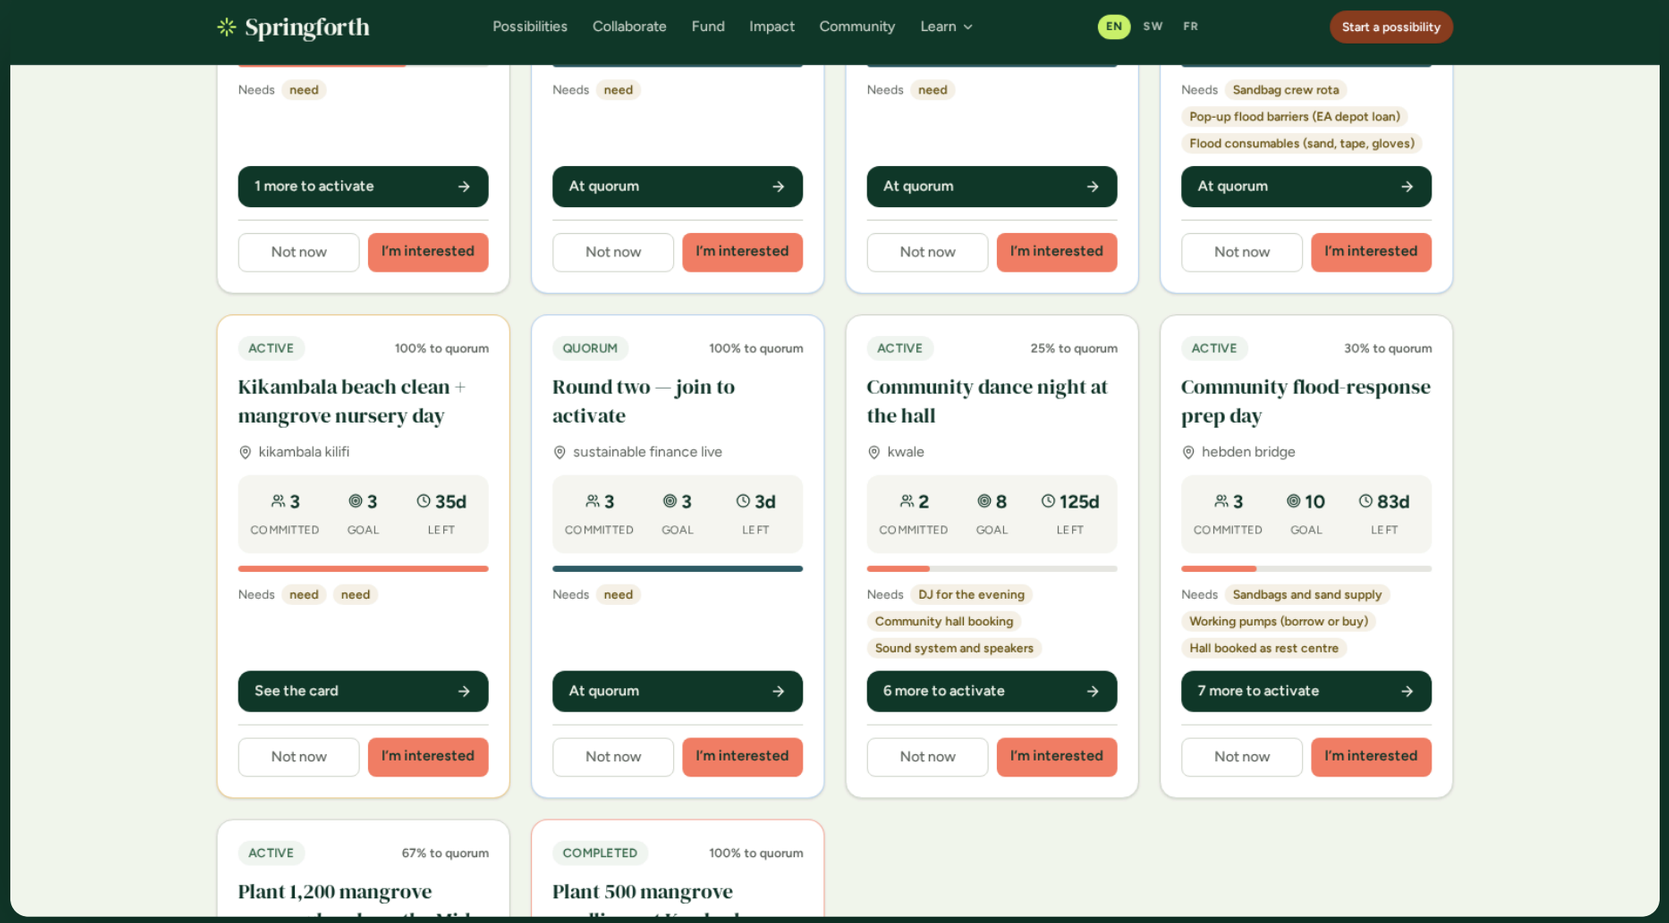

Everything is inspectable.

Demo	springforth.widespread.workers.dev — /how-it-works self-serve
Code	github.com/TerexitariusStomp/springforth — MIT-clean
Ledger	/ledger/verify — hash chain, live
Value	/impact — per-currency, never converted

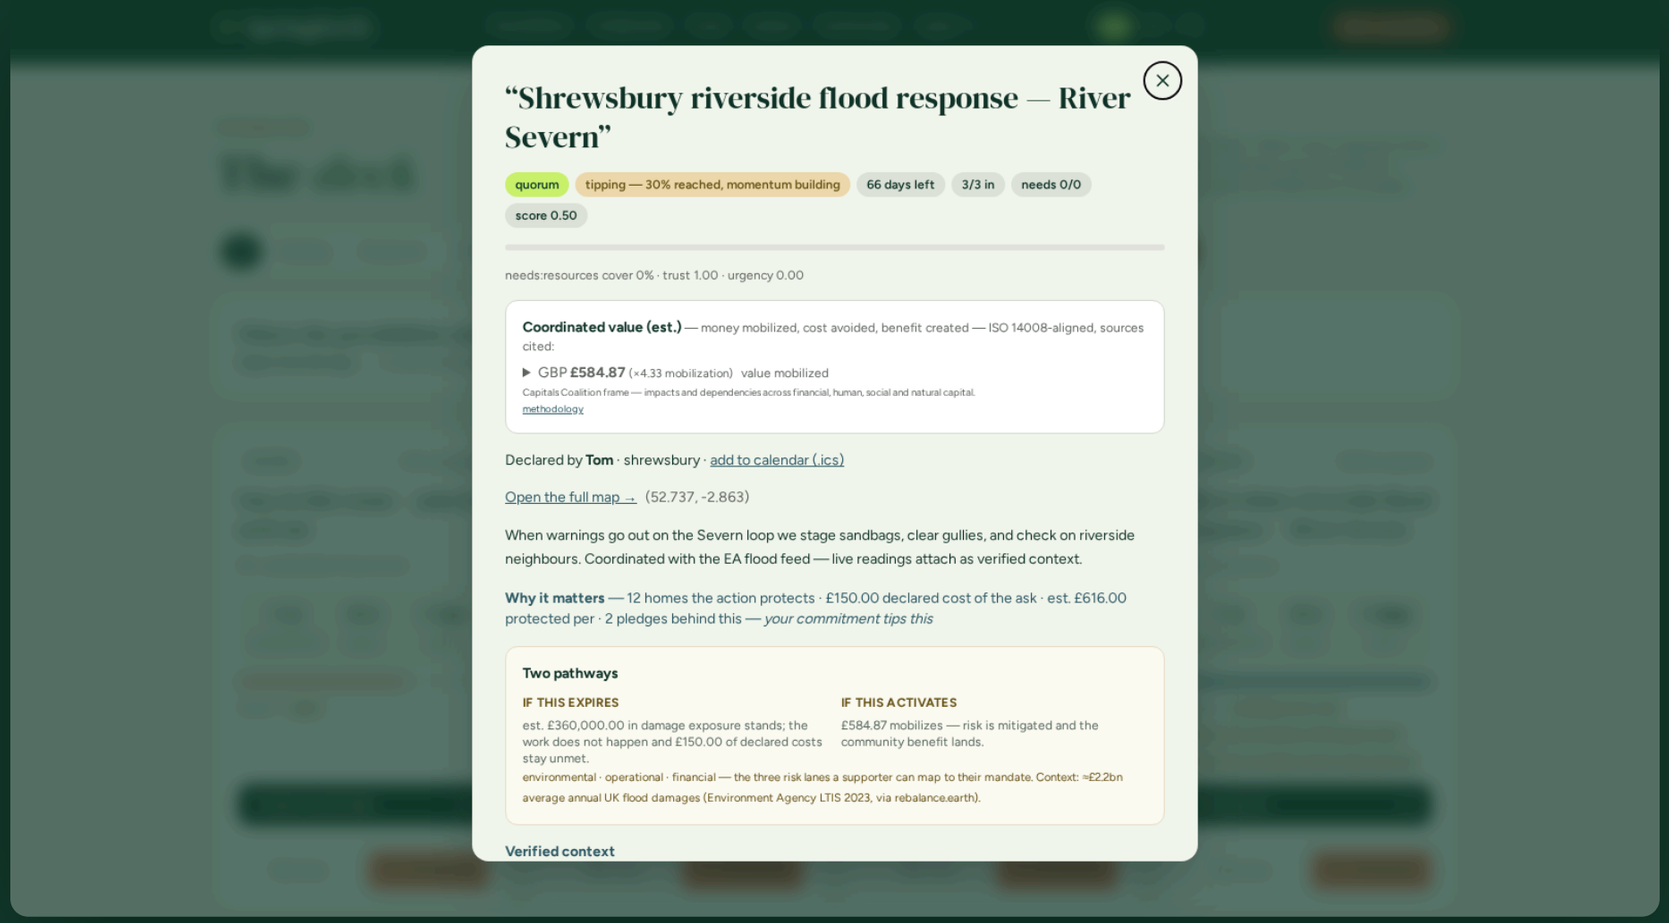

IF THE DEMO FAILS — SAME BEATS, ON SCREENSHOTS

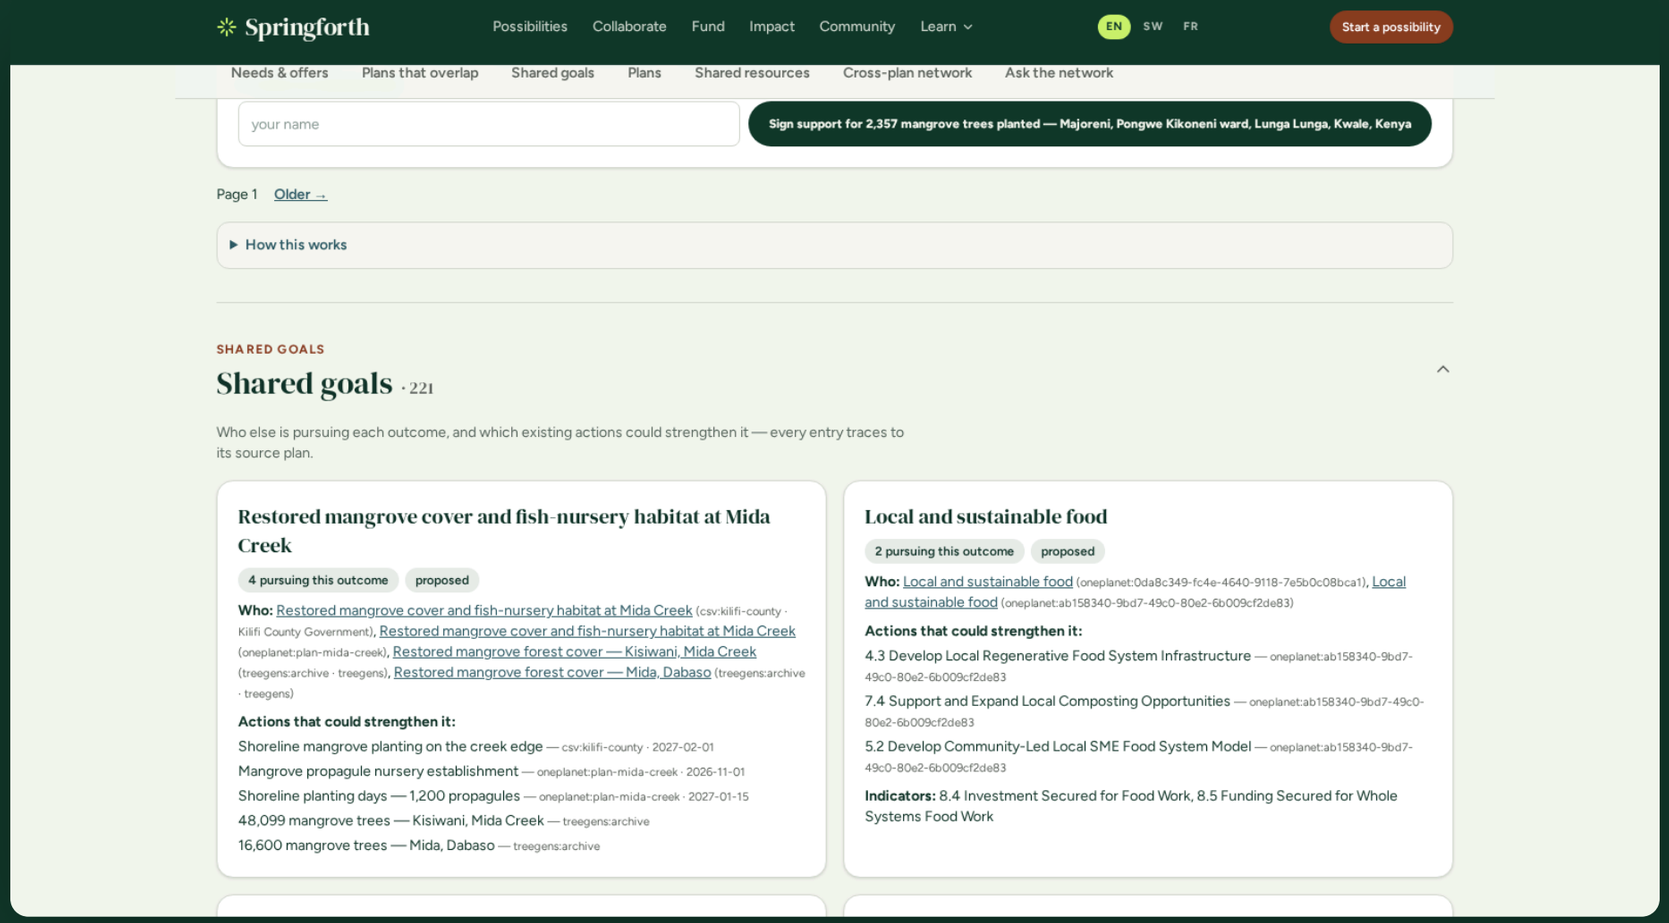

1 · Landing — live stats in the hero.

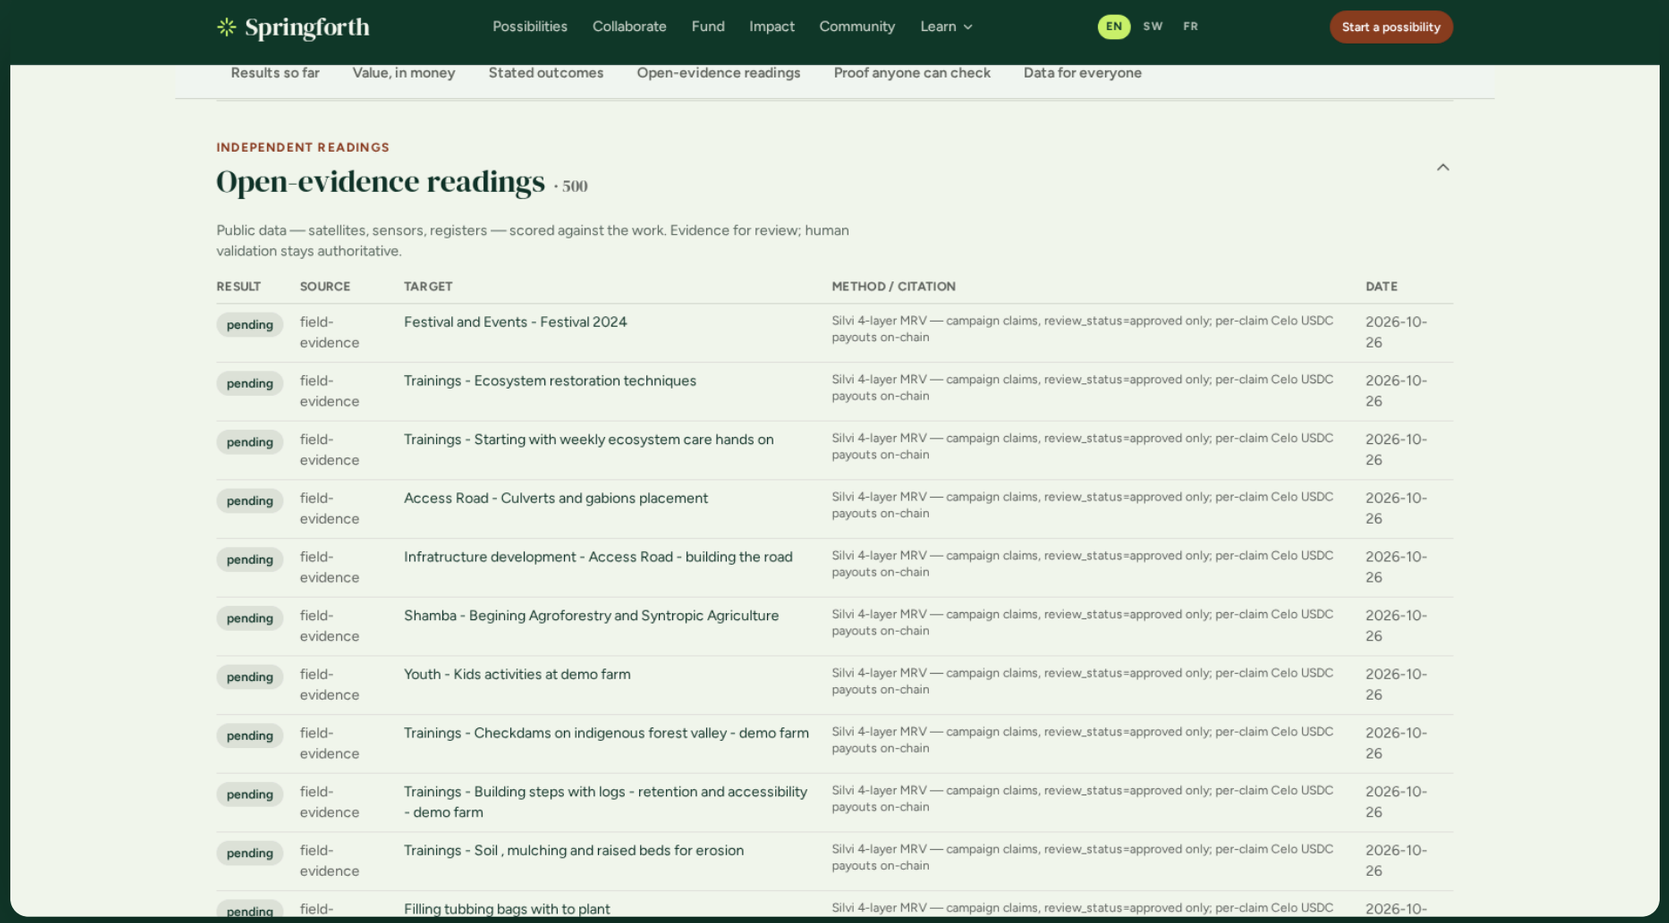

2 · Possibilities feed — reason lines, interest signals, since-engagement badges.

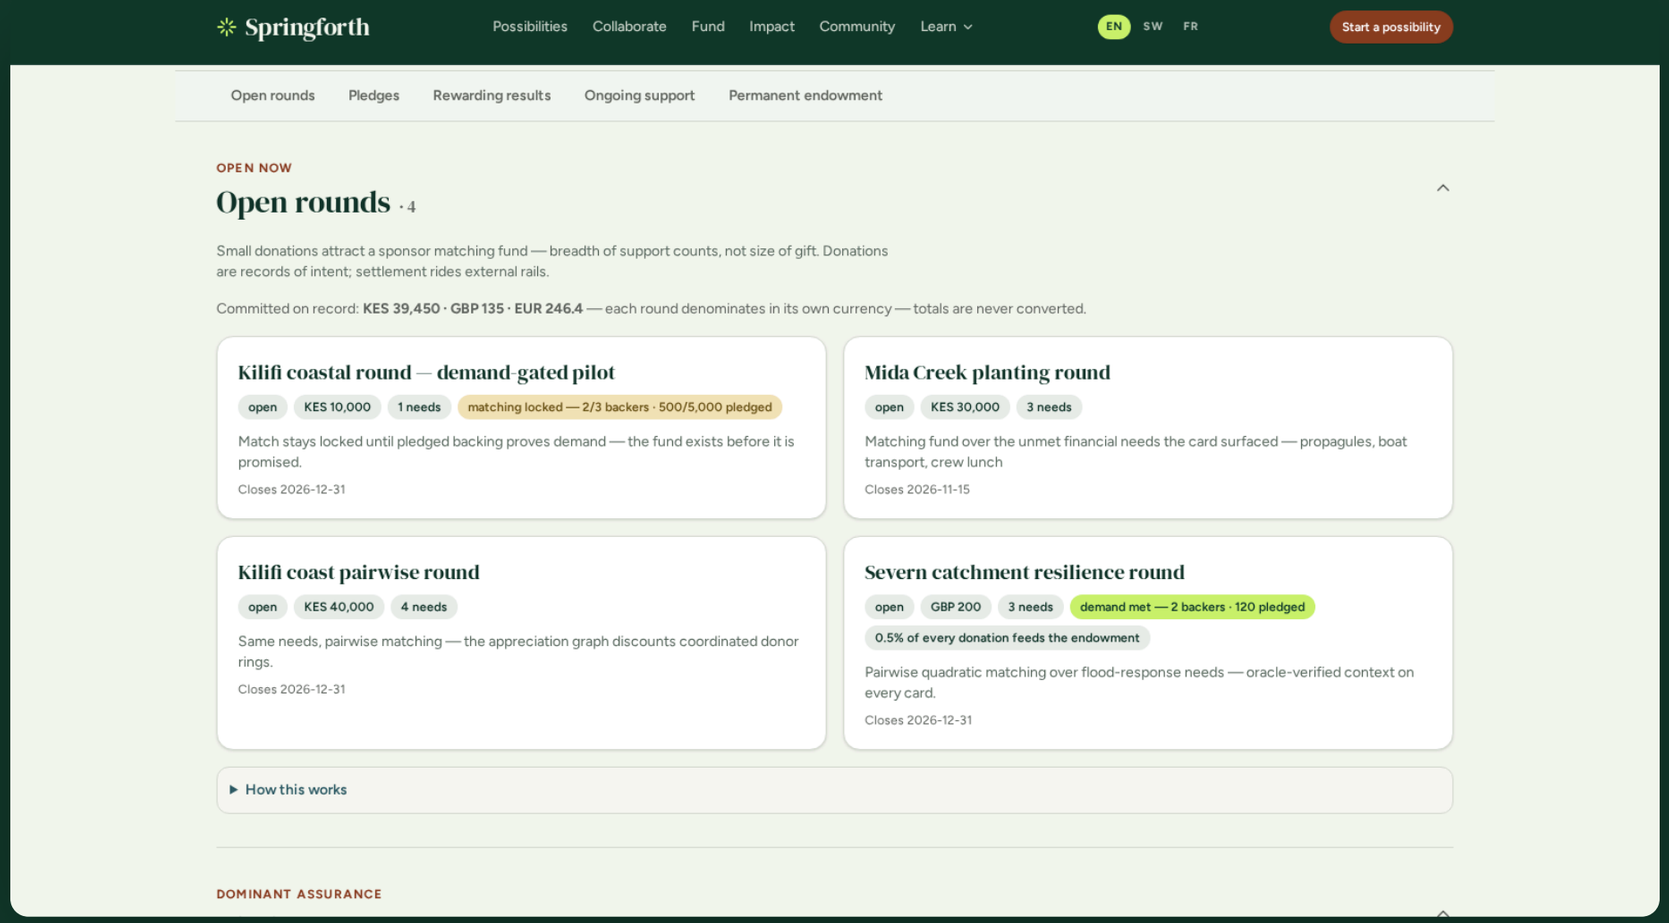

3 · Quorum card — council, forum, audit trail, value block with verifier-replay.

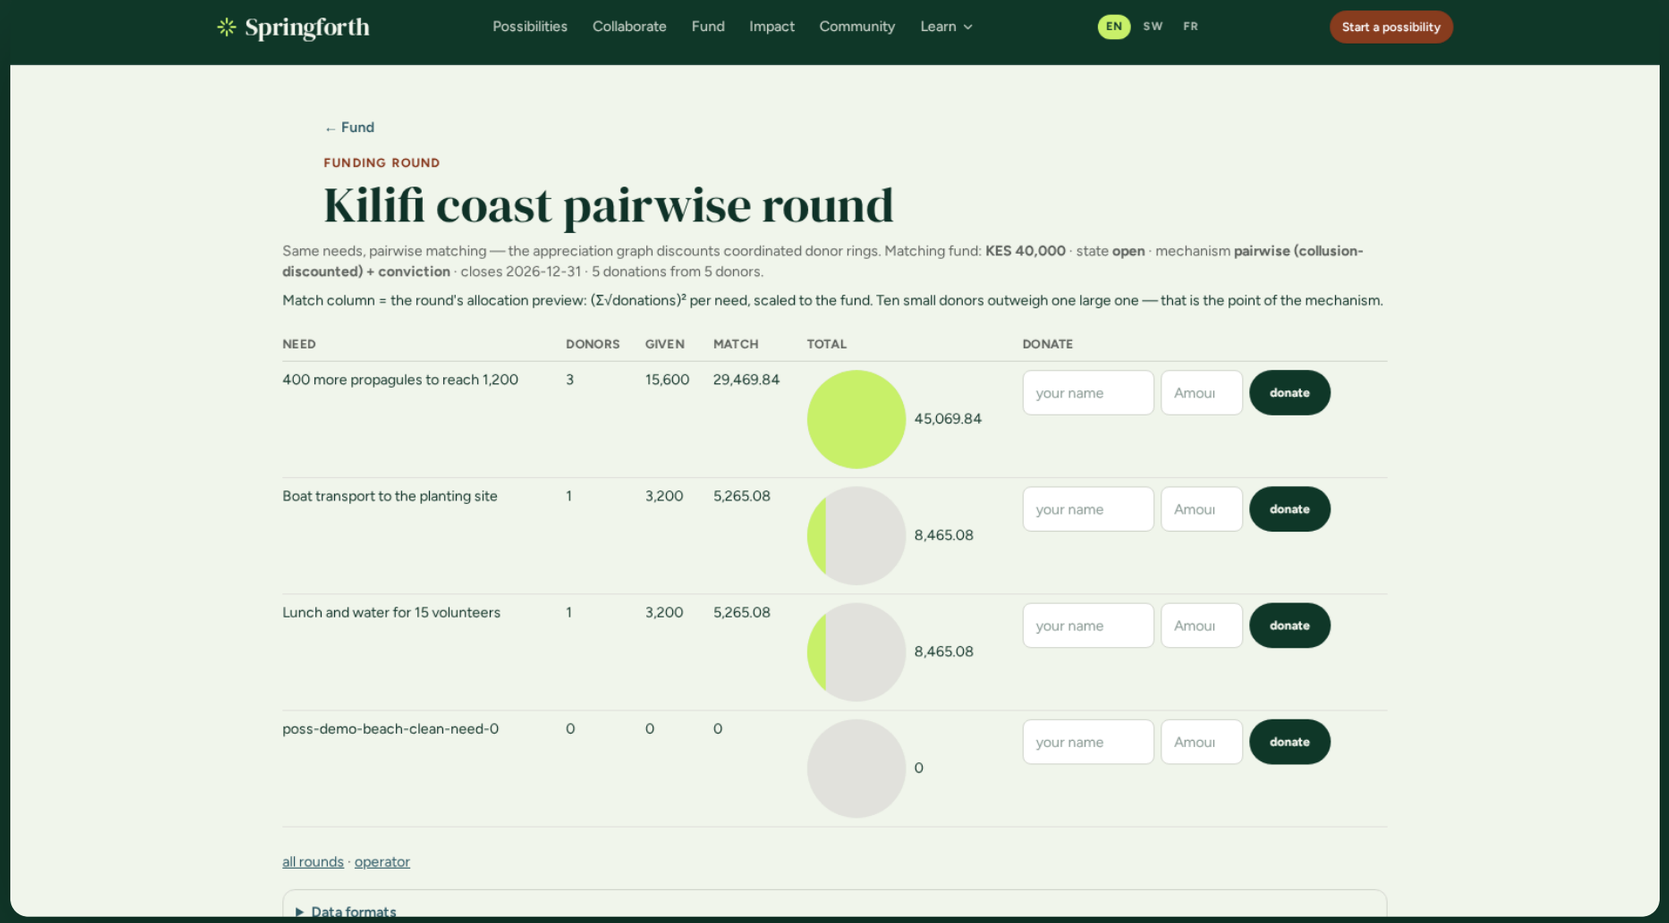

4 · /collaborate#outcomes — four plans pursuing one outcome, Treegens footage.

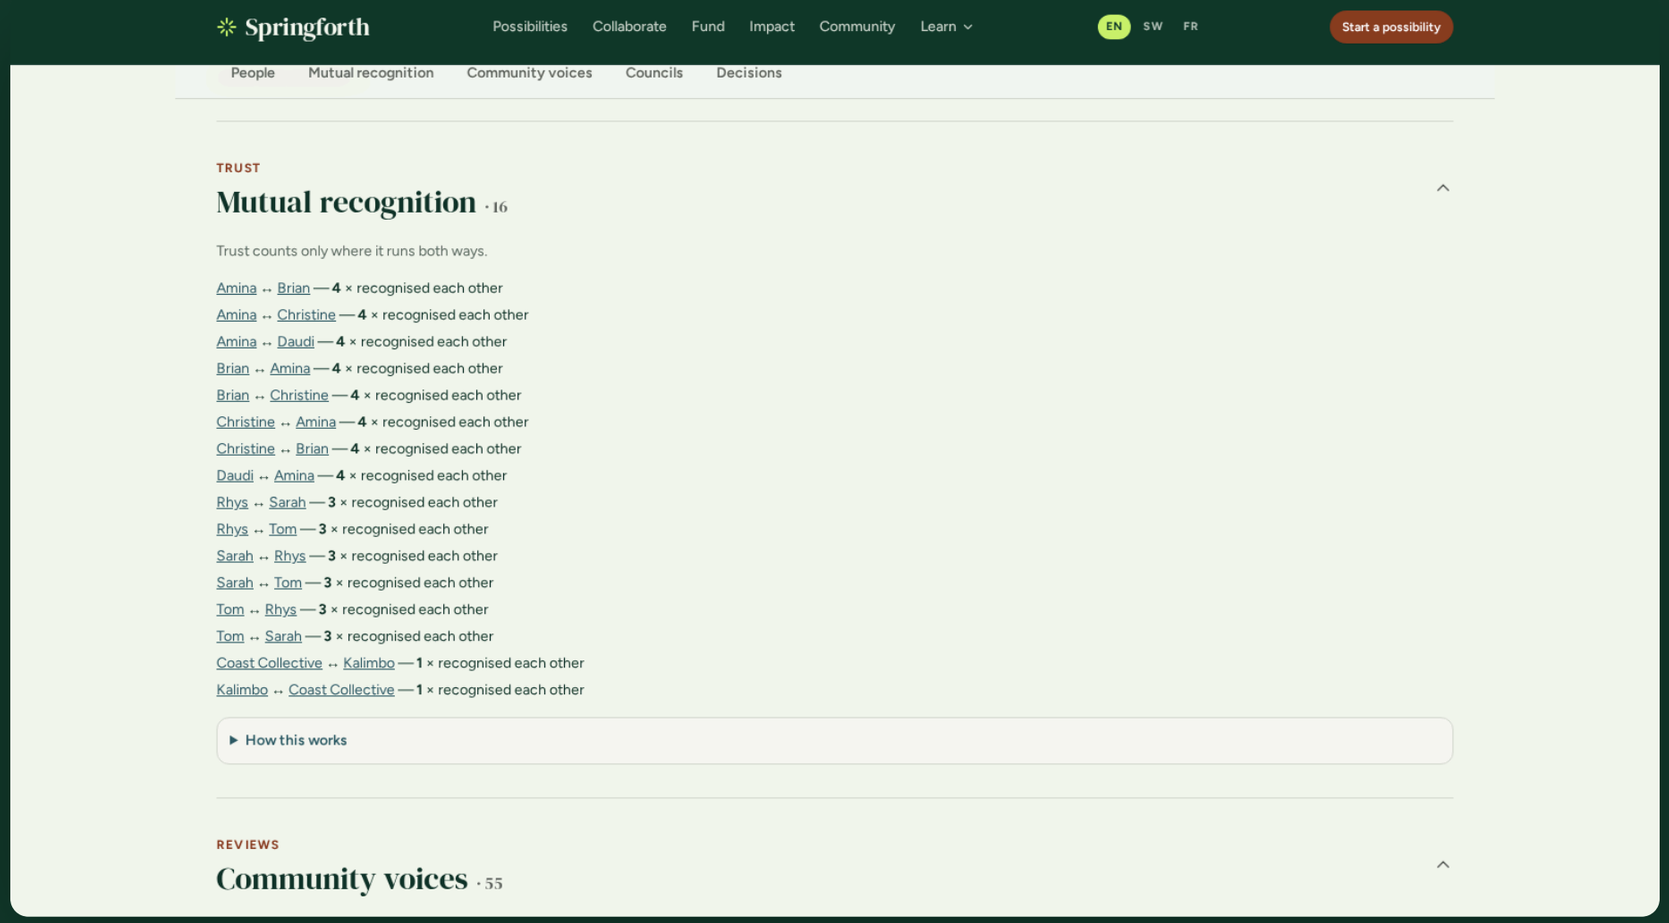

5 · /impact#evidence — oracle checks + methodology citations.

6 · /fund#rounds — demand met vs matching locked, endowment.

7 · Pairwise + quadratic allocation — clique discount visible.

8 · /community — trust counts only where it runs both ways; every edge ledger-attested.
